

## New servo, new luck – a few little changes and Dinosaurier and Roboter will come to life

Due to a production change of our supplier the adjusting wheels of the servo motor have altered a bit. They now require a little modification in order to make Roboter and Dinosaurier work perfectly.

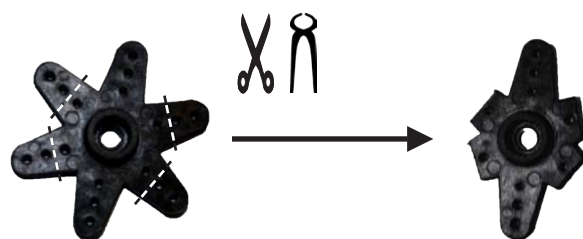

⚠ Hey kids: Please get your parents to help you with this!

The four-armed wheel is for **Dinosaurier**. You have to cut off three of the four arms cautiously with a pair of scissors or pliers. It should look like this:

Now you can mount it into Dinosaurier.

For **Roboter**, you have to shorten four of the six arms of the six-armed wheel cautiously with a pair of scissors or pliers like in the picture:

The adjusting wheel can now be mounted into Roboter.
